The forum preamble : In the third millennium, the world witnessed a significant technological revolution due to developments in information and communication technologies, humans became dependent on technologies throughout their lives. Which was reflected in the style of governance in general and in public administration, which is considered the mechanism that moves the wheel of development in countries and serves citizens. Thus, transformations in management patterns for various sectors have become an extremely important issue and a civilizational imperative for all countries. In this context, most countries of the world have moved towards introducing modern technologies in various fields, including economic, social, political and even administrative. With the aim of developing administrative work and in order to achieve the requirements of the citizen, then integrating multiple and diverse modern technologies into the administration environment in general. Thus appeared what is called the electronic public service or Electronic management. In view of the importance of technological means, and the benefits and developmental gains they produce, many countries have made sure that development and renewal be a basic feature in all their public organizations, by making the application of electronic management their first strategic choice as an effective mechanism to improve the level of services and a pivotal management to rationalize them, based on good governance. Such as effectiveness, transparency, control, spirit of responsibility and speed of response, which achieves the goal of rationalizing public services.

digitization project in activating ways to improve the service, we try to adjust it in five axes.

Like the rest of the countries, Algeria sought to implement electronic administration, through the launch of the Electronic Algeria project 2008-2013. It is the first official scheme that defines the national strategy for electronic transformation, based on the modernization of public administration. Perhaps among the service sectors that have embarked on the implementation of this project, we find the public health sector. Which is considered a vital facility that cares about the health of the citizen in the first place. To know the reality of the application of electronic management in Algeria through the public health facility, the problem of this topic is included in the research, what is the role of electronic management to improve Public services in the public health sector? In order to get acquainted with the issue of the legal system to which the public health facility is subject, and to find out the extent of the success of the, in various fields, including economic, social, political and even administrative. With the aim of developing administrative work and in order to achieve the requirements of the citizen, then integrating multiple and diverse modern technologies into the administration environment in general. Thus appeared what is called the electronic public service or Electronic management. In view of the importance of technological means, and the benefits and developmental gains they produce, many countries have made sure that development and renewal be a basic feature in all their public organizations, by making the application of electronic management their first strategic choice as an effective mechanism to improve the level of services and a pivotal management to rationalize them, based on good governance. Such as effectiveness, transparency, control, spirit of responsibility and speed of response, which achieves the goal of rationalizing public services.

in the public health sector? In order to get acquainted with the issue of the legal system to which the public health facility is subject, and to find out the extent of the success of the digitization project in activating ways to improve the service, we try to adjust it in five axes.

The forum themes

- 1- The first axis: The conceptual framework for digitization "electronic administration" in the public facility
- 2- The second axis: Quality of services as a basis for the digitization of public facilities
- 3- The third axis: The role of digitization in embodying the quality of services in the health facility
- 4- The fourth axis: Obstacles to implementing digitization in the health facility
- 5- The fifth axis: some successful international models in the dedication of digitization in the health sector.

Participation conditions

1. The research should be original and modern, and it should not be part of an author or an intervention.
2. The research should focus on one of the axes of the National Forum.
3. Articles are written in simplified Arabic font 14, and the margins are edited automatically at the end of each page in font 12. As for research submitted in foreign languages, they are written in font 12 Times New Roman. As for the margins, they are edited in font 10. As for the list of references and footnotes, they are written at the end of the intervention.

Important dates:

The date of receiving the abstracts, 20/04/2024
The deadline for receiving the full submission is before 30/04/2024

The date of responding to accepted posts and sending invitations is 10/05/2024.
